Asus t100ta won't boot from usb. Asus transformer t100taf boot from usb. How to boot asus transformer from usb. Asus transformer book t100ta boot from usb. Asus t100ta boot menu.

:) You can see how full the partitions are in Puppy Linux by clicking on the icon to mount them and then in a terminal (maybe be called console) type the command "df -T -h". As I understand it on these tablets the memory is 32 GB of eMMC soldered in and so it is not upgradeable or easy to remove and get data off. And make sure the boot flag is set on the USB stick. Spice (1) flagReport 1 found this helpful thumb up thumb down 2300peterwAAAeAAAATHANKSIA A A That link to the page on how to boot to linux did the trick.I got the 13.4 ubuntu to boot from USB.A A But it doesn't have a gui?A A And I really only know windows.So I took a mint usb IA A had and dropped the A Abootia32.efi onto it. Hopefully it will get to the Window and you will see the icons of the plugged in storage devices and clicking on them will mount and open them. You mat need to run "ntfsfix" to sort out Windows and it may boot again.EDIT. With a tablet I think you may need a USB keyboard and mouse to get it all working without a bit of effort and so with the Linux on a USB stick and the extra storage for any recovered files you can see that 4 ports is good. The kind of speeds you are typically quoted to get are: (USB 2 port - About 240 Mbs) (USB 2 FlashA A - Write About 40 Mbs) (USB 3 Flash - Write About 160 Mbs with a USB 3 port) and (802.11gA A - A A 11 Mbs). can't see files thought (it filters the view for the bios file extension)?A A So it looks like the windows drive IS there.Starting Clonezilla again, that sees:mmb1k2p1 100mb vfatA Ammb1k2p2A A 700 mb ntfsmmb1k2p3 128mb reserved partitionmmb1k2p4 28.2gb ntfsda1A A A A A7GB NTFS restoreSo the windows partition is on different hardware than the restore partition?Any thoughts why clonezilla is the only thing that sees that 28.2GB partition?Clonezilla fails with several errors, 1 of which isunkown partition table format for file had had removed the clonezilla thumb drive to insert a 32GB thumb drive to write to.A Clonezilla seems to run ok (it's all in RAM?). I think that people need to be very aware that they need backups for any data, especially if they have soldered in memory.A 32 GB of memory is not "fit for purpose" to run Windows and will jam up with updates. Just drag any wanted files to the storage.It may be that Windows is jammed by the limited tablet storage and so when you have dragged everything you need off and you are happy with them, delete the ones on the tablet. It is stated that on other forums the keyboard has a provision for storage as well and some use that. You will have to do more research as to how to bypass this. As that tabet boots you can try pushing F buttons to get into the Recovery Mode that is on that Flash Disk Spice (1) flagReport 1 found this helpful thumb up thumb down 2300peterwAAAATHANK YOU VERY MUCHIA A I got it to boot and I'm copying files from the internal drive to a USB.I am using Beyond compare, a program I like in windows. I realize I am more of a - got a hammer? If I wanted to keep items synchronised or I wanted to transfer large files over the internet then I would use rsynch. A According to this reference it has a 64-bit CPU combined with a 32-bit EFI which is unusual and maybe the reason why some Distros don't like booting on it.A I recommended a 32 bit UEFI version of Puppy which should boot. Use the 32 bit UEFI version. After getting any data you want off delete as much of the files that you can.. Looking further I see that there is a Video of a Puppy Linux in actionA A And there is a later Puppy 32bit UEFI hereA A Spice (1) flagReport 1 found this helpful thumb up thumb down That tablet has 32 GB of storage as a maximum sum of the storage partitions on the eMMC storage.A A And it is divided up as:EFI System or ESP isA Ammb1k2p1 100mb vfatMicrosoft Reserved Partition MSR isA Ammb1k2p2 700 mb ntfsSome kind of Utility Partition for the tabletA Ammb1k2p3 128mb reserved partitionWindows main PartitionA Ammb1k2p4 28.2gb ntfsOn that tablet they have added a separate normally hidden 7.5 GB flash disk for recovery.A Asda1 7GB NTFS restoreAny data you want to recover is inA Ammb1k2p4 and I advise you to get the data off into a safe place before trying any repairs.I suspect that the tablet has jammed because of too much data onA Ammb1k2p4. And you could try a Puppy Linux to look at the files. I use different ways of transferring data depending on what I want to do. I don't have a A constant go-to way of tackling the task. Everything looks like a nailA A Use 1 thing I like for everything, even if it's not the best fit. So for you the fastest route is likely to be the USB 2 port with the fastest storage you can which will be USB 3 storage even though it cannot go at a full rate. They should never have been put on the market with such an inadequate amount of storage.I guess that when last used Windows went into a sleep/hibernation mode so that it can startup faster and when in that mode it inhibits booting of a USB. If I was using Puppy Linux and only taking the Users Folders and Files from the tablet then I would just drag and drop them onto the storage. Spice (1) flagReport 1 found this helpful thumb up thumb down To shut down the tablet properly, try doing a very long press on the shutdown button before pressing again to start up to get into the BIOS. See you have tried startx. Thank you again!A A I think I tried that - dragging the folders - users, windows, program files, etc.A A But it hangs (as does beyond compare).A A But with BC, I can pick up where I left off, see how close I am to being done, skip files that are giving problems, etc.A A All that I much prefer your mindset - use different tools as needed. It's a graphical program / lets you see differences between 2 drives / folders, etc.But it's slow on this machine.How would you copy off the data onto a USB? Spice (1) flagReport 1 found this helpful thumb up thumb down 2300peterwOK, I got different things to boot - clonezilla, linux, etc.I tried cloning what clonezilla found was a 28.8GB partition, but there were errors.In one of the linux, it had gparted.A A Started that and it didn't see the 28.8GB partition..A A It does see a 7GB NTFS partition that's marked as recovery.A A I looked in there and didn't see the current OS / windows install.(oh, in the T100, there's a fast update for bios.A A That sees the windows drive structure - windows, users, program files, etc.... I have both externally powered hubs and ones that manage to work with the master USB power.I am surprised that you did not get a GUI with Ubuntu but you may with the terminal command "startx" without the quotation marks.Puppy will load into RAM and run from there. They are very cheap and typically allow one USB port to service 3 or 4 other devices via the hardware ports it has. but i have to see if I can plug in a USB hub to have an external hard drive?Or when you boot from USB, the entire OS is in RAM? A A Or make puppy on a big USB so I can copy to the puppy drive?and even graphically, what's the best way to copy everything from 1 drive to another?A A I like beyond compare.A A I guess I'll try puppy and see if it runs faster? Spice (1) flagReport 1 found this helpful thumb up thumb down 2300peterwAAAATHANKSIA A i CAN get into the bios.A A that's not a problem.A A (press / hold the F2 key THEN press / hold the power button till it boots into the bios).It's getting it to boot with a device in the usb 3 port.A A I followed videos to boot into bios, turn off secure boot, etc.A A then boot, press f2, go into save / exit and choose boot override of the thumb (which it DOES see).A A screen flashes a second then back to that page.A A ADoesn't like / can't boot off USB ?A A I've tried at least 1/2 doz devices that DO boot off other computers no problem.A AArg! Oh, I had youtube open and it autoplayed another video.A A talked of holding esc and turning on machine.A A that got me to a boot menu - windows boot manager / uefi: vendor coproductcode / enter setup.A AChoose windows boot manager and you get the windows 4 tiles & spinning circlechoose uefi and it blinks and goes into biosenter setup goes into bios. For that tablet with a maximum of about 8 GB of user data to transfer it should be done within the hour.Have never used the Beyond Compare product but it seems to have a good GUI interface and can be used with Windows and Linux. You have choices for moving data of the tablet and that is go via the USB 2 port to USB 2 or 3 storage or via the 802.11g network interface to some fast storage. Now I'm getting a GNU GRUB screen with grub> command line when I try other linux.A A A that's the bootloader?I just tried with the 13.4 again, got the boot menu, chose try the OS.I thing it doesn't like the screen?A A I get the command line and try startx and get 'fatal server error: no screens found,now to google commands to use at the command line..A A Right, with only one USB port you need a USB hub to do anything useful. I was able to boot off it and get to a GUI.But clicking on things doesn't do anything.A A the cursor moves and the icon highlights when I click on it.A A But file explorer doesnt open.A A Haven't waited 2 hours for it to open maybe?;ll google, but you know some commands to mount the internal drive and copy everything to it?A A another issue is that there's only 1 USB port.A A I need the mint to be in thereA A to boot. boot.
